

Traffic Safety Seminar

On 24 October 2014 a Traffic Safety Seminar was held in Craiova and was organized by the University of Craiova – Faculty of Mechanics – Department of Vehicles and Transportation with the co-organizers SC Urban Control Systems SRL, AVAC and Society of Automotive Engineers of Romania.

The event benefitted of an outstanding organization and took place in a cooperative atmosphere of mutual respect.

At the conference there were presented several case studies on traffic safety on behalf of a couple invited national and private companies. Also after the presentations the attendance organized into studies groups in order to discuss in more details the information received.

The attendance learned about the encouraging developments that have taken place in Romania and in the Oltenia region. The participants listened with interest and appreciated information given by speakers about interventions and road safety practices that brought significant reductions in road traffic casualties.

The participants welcomed the encouraging positive developments but recognized that road traffic casualties are still dramatically affecting the country and the road safety is not anymore just a transport issue, but it is a health, social, financial and economic hazard, negatively impacting on the region and country development.
